12 \section{Abstract}

13 BlastSmart is a mobile application developed to simplify, improve, and increase the accuracy of blast calculations used in surface mining. The application consists of a mobile app called BlastSmart. The app will help mining engineers by making blast calculations simple, efficient, and more accurate than using pen and paper.

14

15 It primarily focuses on two major parts of the app, namely" the Surface Blasting Design Calculator," which calculates the burden, stemming length, and actual powder factor, and a using input from the user. The second part is the "Fragmentation Calculator", which estimates the mean fragmentation size using the data from the Surface Blasting Design Calculator. By reducing the need for manual calculations, the app helps mining and also complying with international standards to make sure everything is clearly and recently updated.

19 \section{Background}

20 The mining industry is using using more more technology to improve safety, accuracy, and productivity. Blast design is one area that can benefits from greatly by the use of technology because engineers must perform several can use it to perform necessary calculations before blasting. These calculations direct are important because they affect rock fragmentation, productivity, blasting costs, and worker safety.

21

22 Many engineers still perform blast calculations using pen and paper, which is time-consuming use pen and paper to do calculations, which is slow and increases the risk chances of human error. There is therefore a need for a simple and reliable digital solution that streamlines the c Deleted by you on 17th Jul 2026, 2:27 pm while reducing human errors. BlastSmart is made BlastSmart app will make this process easier and faster by performing calculations and providing reliable results. The app is created to solve the problems that are faced when doing the calculations manually. BlastSmart allows users to enter the needed information and calculates the results the user wants.

23

24 This project focuses on two address this need by replacing manual calculations with a faster and more efficient digital approach. Functions, the Surface
